Relationship between flowering time & pollen to ovule ratio

Studies have shown a positive correlation between flowering time and pollen to ovule ratio

Sexual Allocation

- Pollen to ovule ratio (**P:O**) is a measure of sexual allocation
- Sexual allocation is the amount of resources a plant puts into its male vs. female reproductive organs
- Sexual allocation has a direct effect on a plant's reproductive success

Flowering Time

Why does flowering time matter to us?

- Harvest time
- Tourism

Why does flowering time matter to plants?

- Pollinators
- Seasonal changes

Genetic Correlation

- What causes it?
 - Pleiotropic effect
 - Linkage
- What does it cause?
 - Traits will evolve together, not independently

We are testing to see if the observed positive correlation of flowering time and sexual allocation is a positive genetic correlation.

Clarkia xantiana ssp *xantiana*

Kern County & Lake Isabella Area

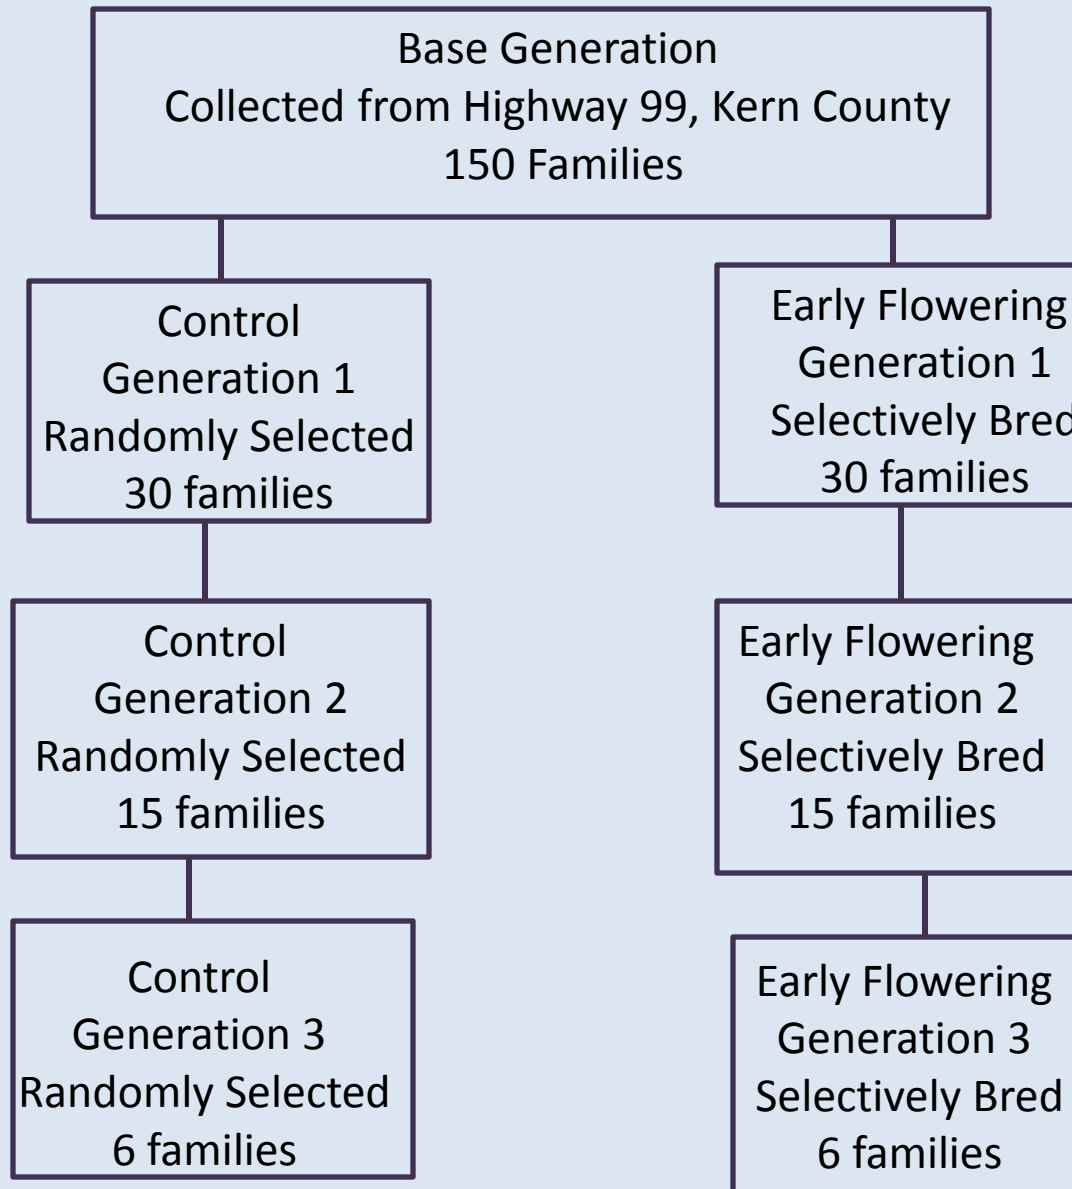

Greenhouse selection experiment

The focus is to compare the pollen to ovule ratio between early flowering plants and a control group

Clarkia Lines

Methods

Bud with ovary attached

Clarkia with anthers

Ovule Counts

A dissected *Clarkia* ovary
with ovules

Cross section of an ovary
with locules

Pollen Counts

Clarkia pollen grains

Cross section of an anther

Predictions

Prediction 1

Since early flowering plants flower notably sooner than the control group they will have a lower P:O

Implication

Traits are genetically correlated and evolve together.

Predictions

Prediction 2

Early flowering plants would have about the same P:O as the control.

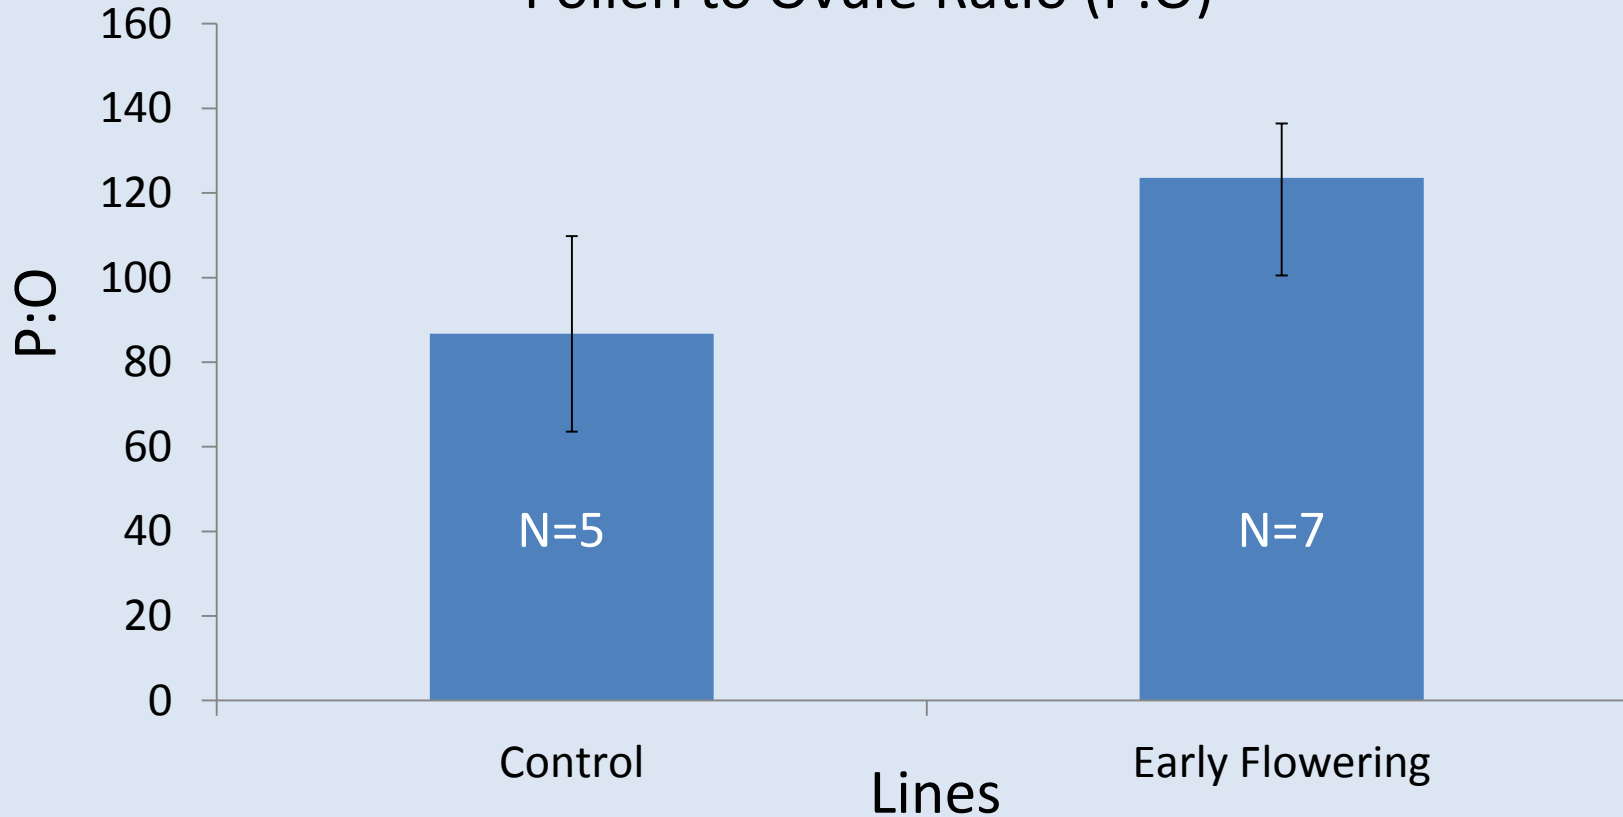

Implication

traits are not genetically correlated and evolve independently

Progress to date

Pollen to Ovule Ratio (P:O)

The average P:O ratio is higher in early flowering plants.
Preliminary analysis indicates there is no statistical difference between the two.
Data supports prediction 2

In conclusion

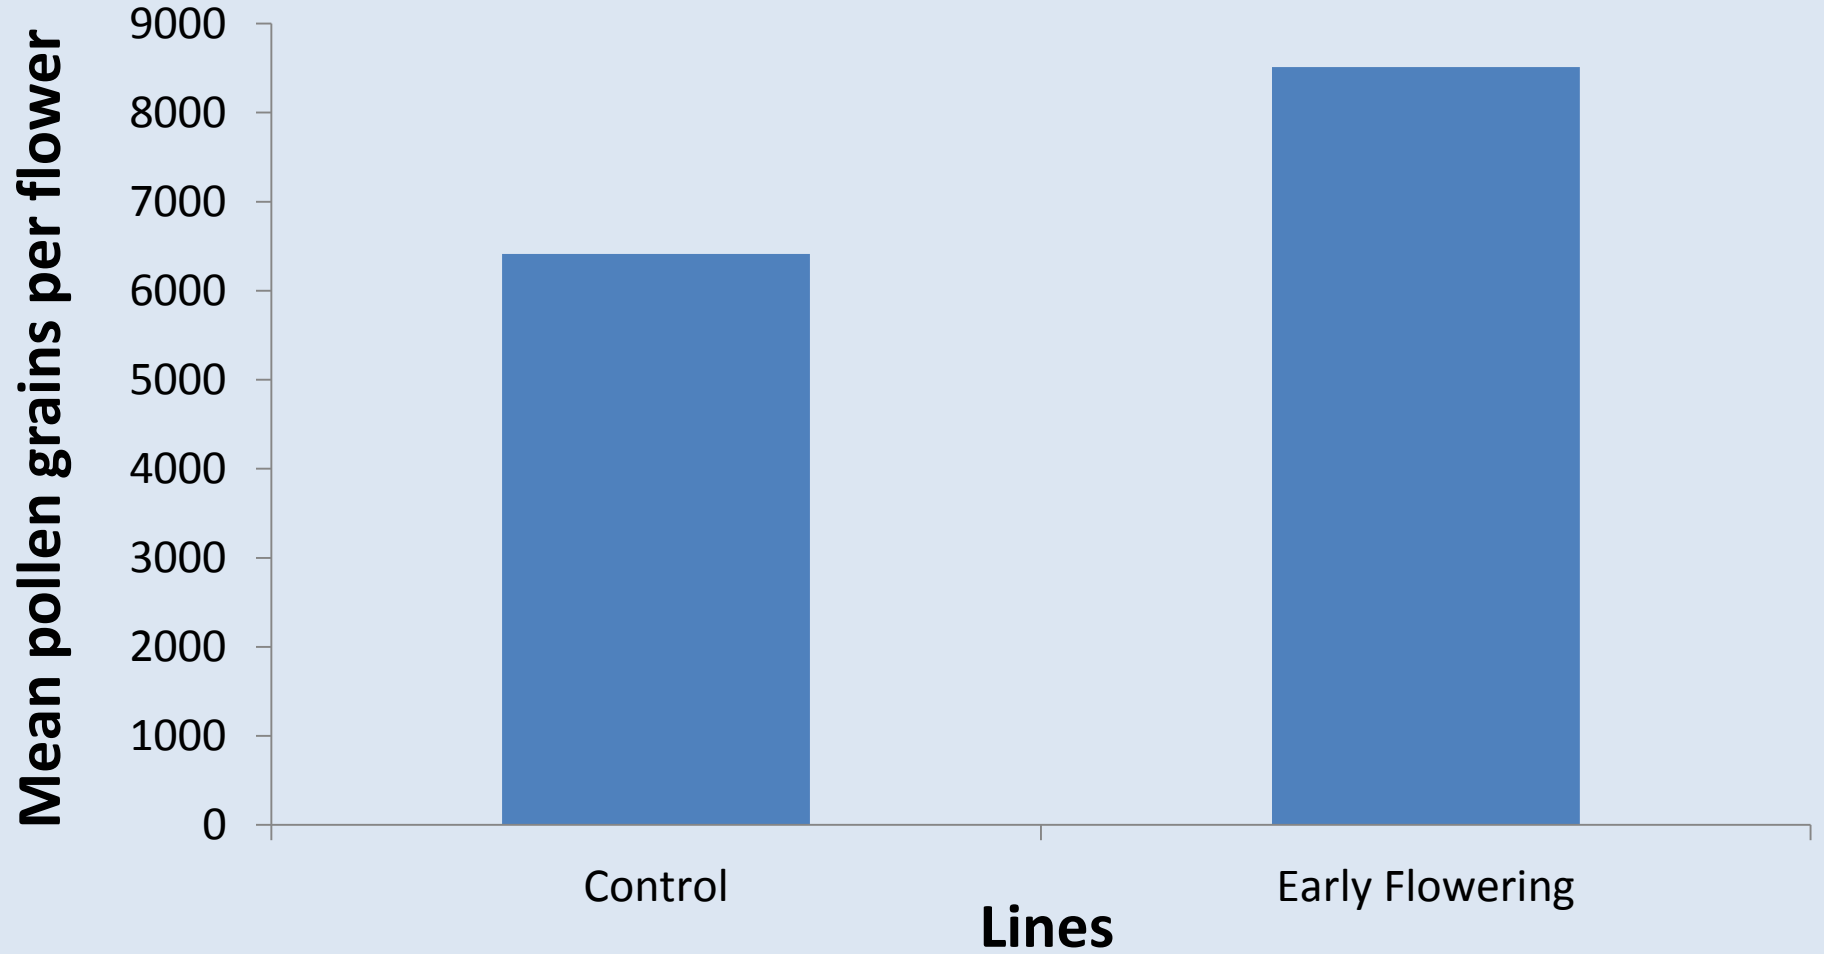

If sex allocation and flower time are selected for independently there must be a selective advantage in order for both of these traits to evolve

Acknowledgements

Thank you

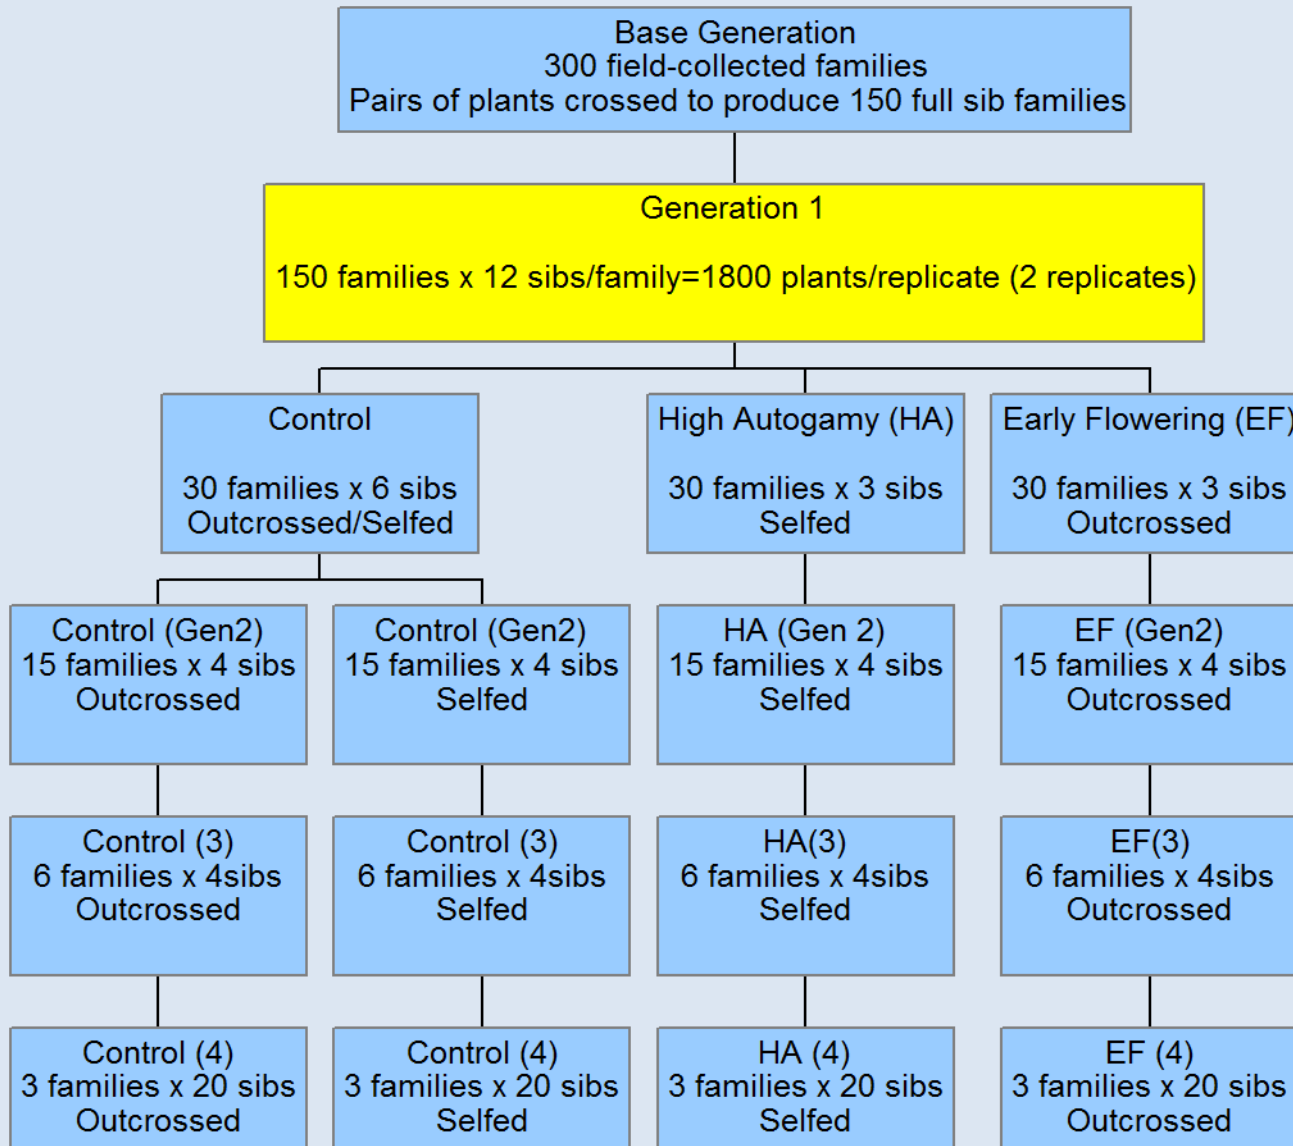

- Dr. Mazer and Dr. Dudley for sharing your knowledge and giving me this amazing opportunity
- Bridget Bedsaul (REU) and Javier Cervantes (RET) for being such a great team to work with
- Jens-Uwe Kuhn and Nick Arnold for your support and help through this process
- NSF for funding undergraduate research

Pollen Count

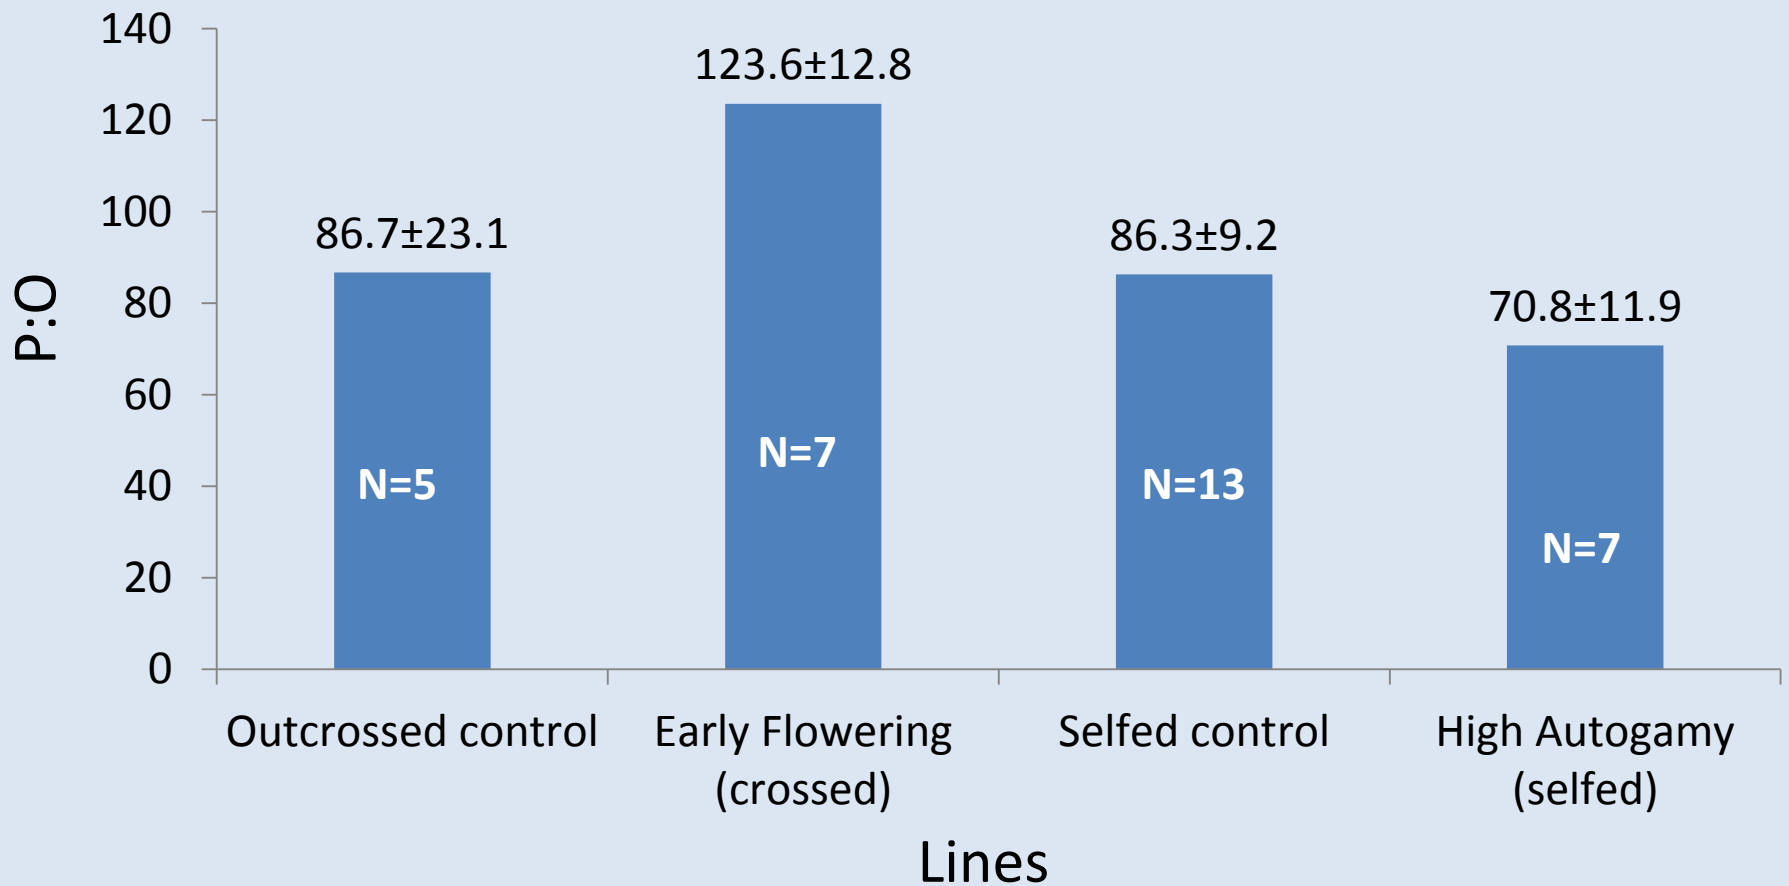

Ovule Count

Results including HA and HA control

Pollen to Ovule Ratio (P:O)

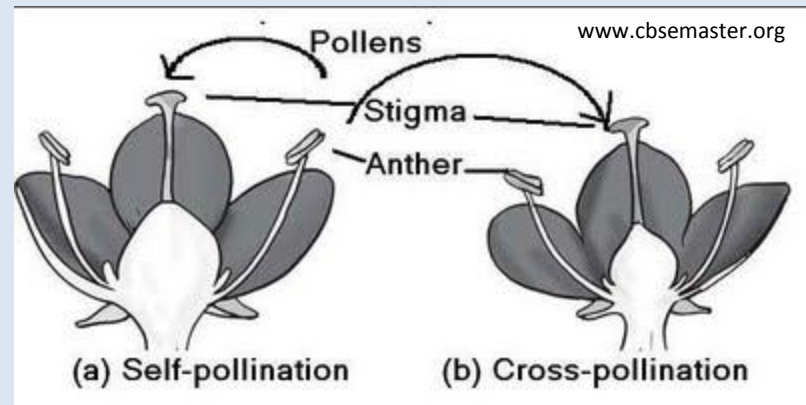

Future Work

- Complete the data set (N=30 for each line)
- replicate the experiment for another taxon
- Look into the selective advantages of flowering time and P:O
- Look at another trait and it's relation to P:O

What is a mating system?

A **mating system** is determined by the pattern of union between egg and sperm within or among individuals.

Two different mating systems
(a) self-pollination and (b) cross-pollination

Importance of mating system

Understanding the factors that may lead to the evolution of self-pollination which in time may cause lower fitness

Reasons mating system may evolve:

- Environmental cues
- Correlated traits
- Reproductive assurance

Mating System & pollen to ovule ratio
